

How do **embedded researchers** bridge the research-implementation gap in public health?

Presenters: Dr. Rachael Edwards & Sarah Lester

Co-Authors: Dr. Dylan Kneale, Dr. Claire Stansfield, & Rebecca Goldman

How research active do you consider yourself?

- a) Research is my life!
- b) I dabble
- c) If only I had time
- d) Research is someone else's job
- e) I avoid it at all costs!

What are embedded researchers?

We used a set of principles to **define** embedded researcher activity.

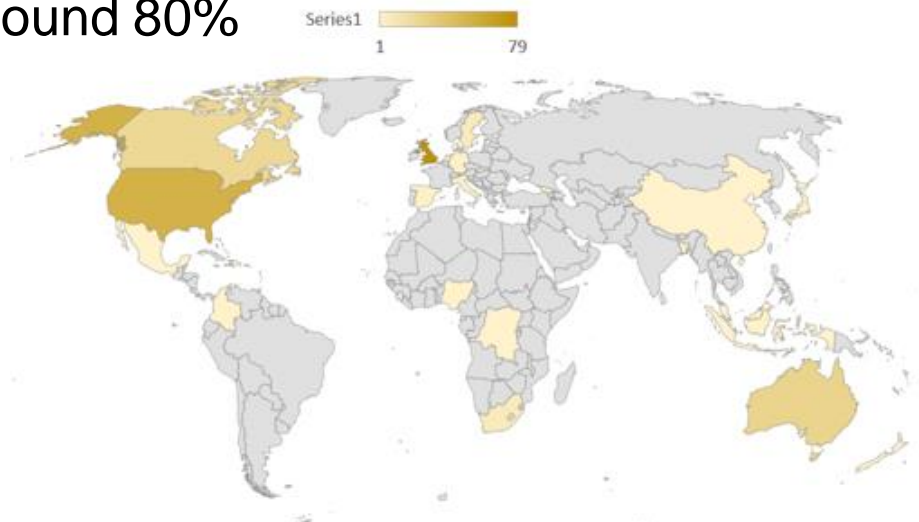

Embedded researchers:

- **enable research activity**
- have **dual affiliation** across policy/practice and research organisations
- develop a **two-way**, mutually beneficial **relationship**.

Our **systematic map** found 80% of studies were from:

- UK
- USA
- Australia
- Canada

Studies focussed on a range of disciplines:

Clinical Health & Primary Care	39%
Public Health	14%
Social Care	7%
Education	7%

Case study and methods

- 24 embedded researchers based across 15 English **local authority public health teams**
 - 16 public health leaders with time bought out for research
 - Public health leaders and embedded researchers often paired
 - Aim: **Enhance research activity** in local government public health settings
-
- Interviews with embedded researchers (N=17)
 - Interviews with public health leaders (N=12) and collaborators (N=7)

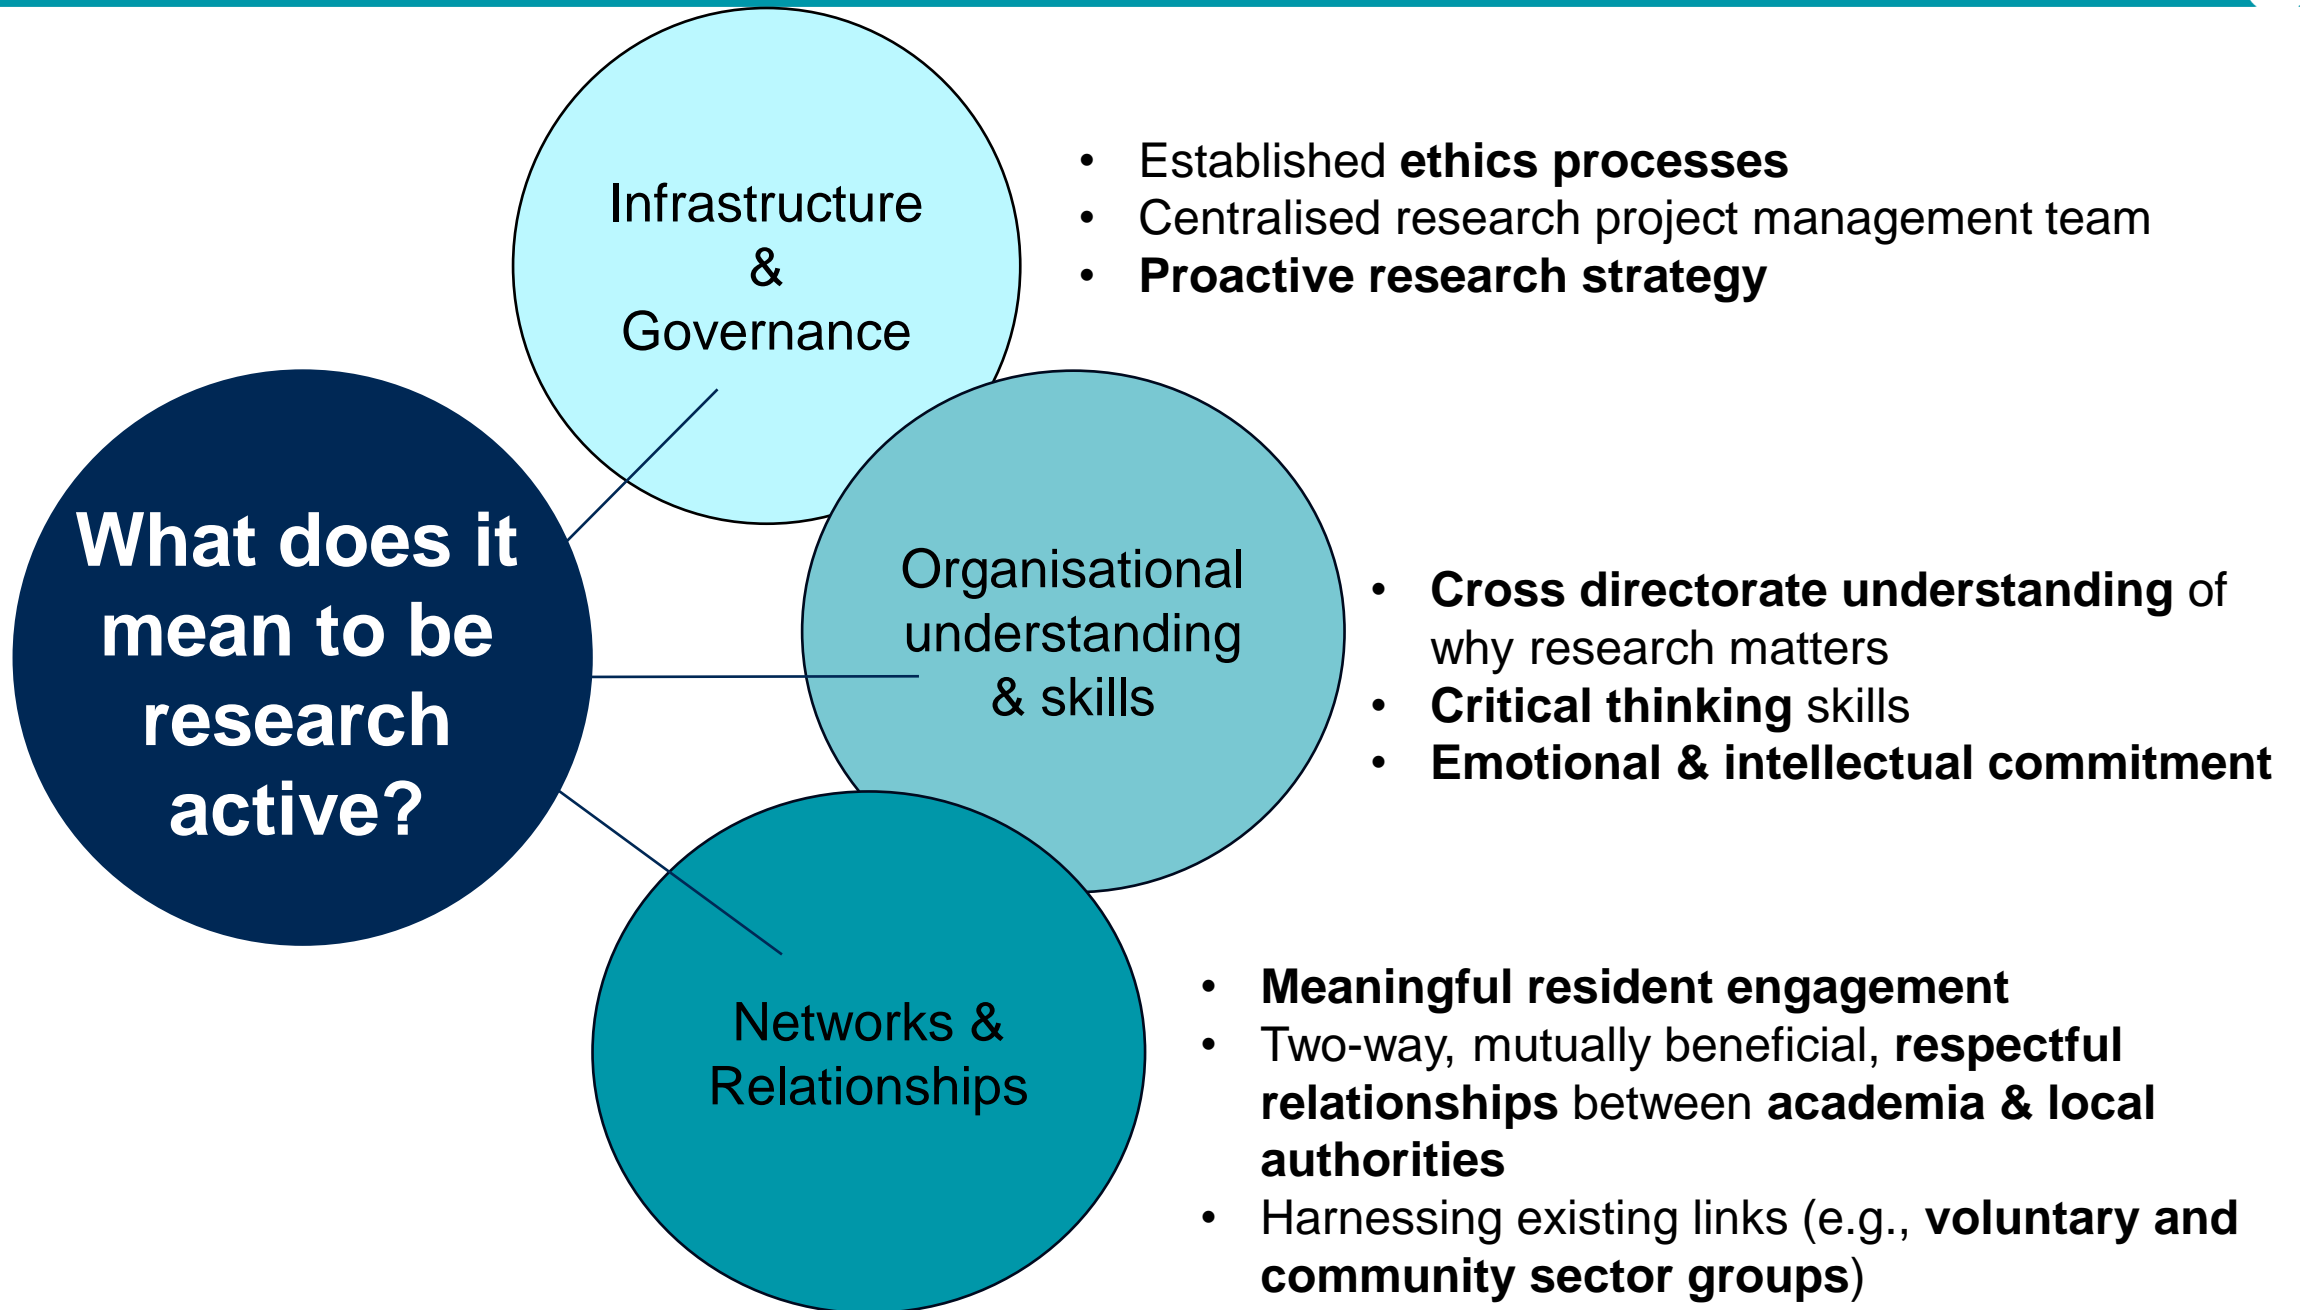

What does "research active" mean in policy/practice settings?

Choose up to 3 words or phrases.

Use QR code

Starting point and barriers to research activity

- Research cultures ranged widely from being a 'very receptive local authority which really values research' to 'research naïve' to 'very inactive'
- Insufficient research infrastructure
- Varied research skills
- Varied levels of senior endorsement

Barriers to research activity

- Lack of capacity (time/funding)
- Adverse response to the word "research"
- Lack of trust in academia

Opportunity: Strong appetite for evidence informed decision making

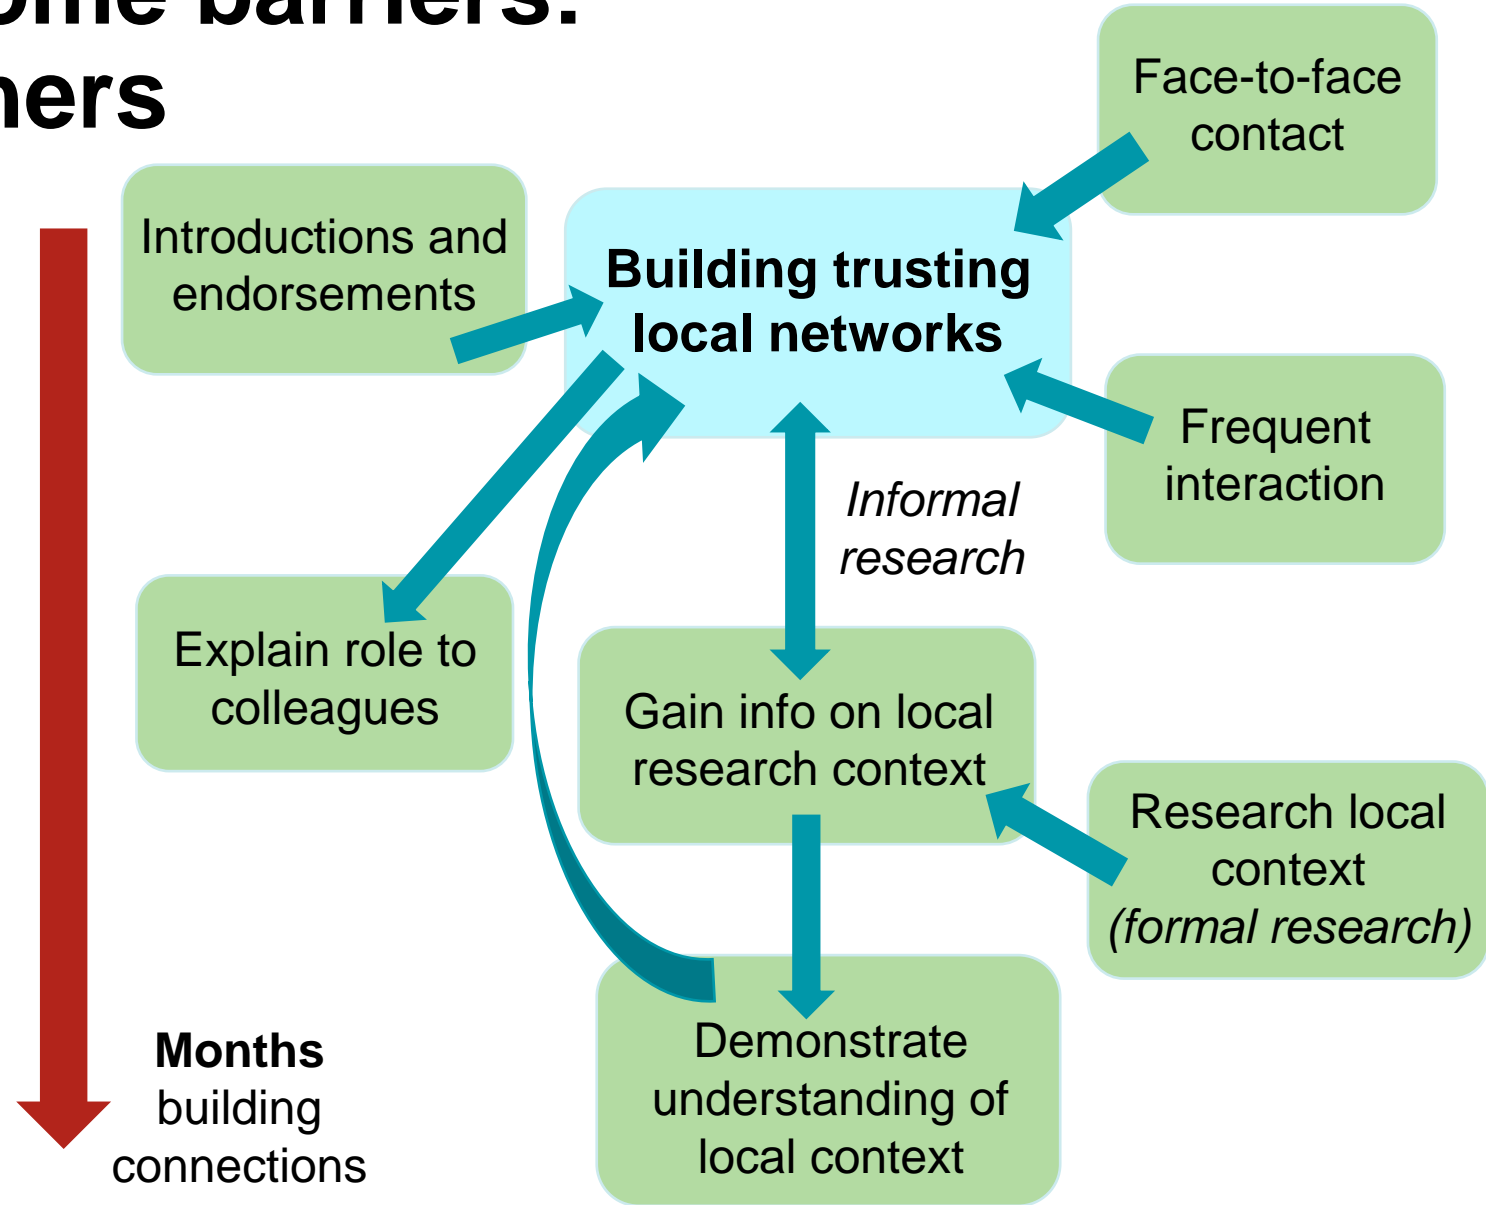

Unfortunately, there are some people that get a nosebleed if you use the term research.
-Public health leader

And it's not that they don't want to do [research], it's just that they don't have the capacity to do it.
-Embedded researcher

Strategies to overcome barriers: Embedded researchers

You need that physical presence, and that repeated physical presence for people to get to know you and trust you.
-Embedded researcher

it was quite a lot of effort required to hammer home the message about who we are, what we're doing, what the point is.
-Embedded researcher

Activities to enable research activity

Facilitating research connections and opportunities → e.g., institutional bridges

Supporting research → e.g., advising on methods and research Qs, supporting funding applications

Applying for funding → e.g., HDRC

Conducting research → e.g., academic and internal research **but...**

My job is to enable the research, not to do it for them.
-Embedded researcher

Organising training opportunities → e.g., journal clubs, workshops

Creating research networks → e.g., regional networks of public health leaders, online networks

Strategies to overcome barriers: Public Health Leaders

Sending signals and making research roles visible

- Changing e-mail signatures to make colleagues aware
- Providing training, workshops and events across the council
- Demonstrating research projects across the council

Adapting language to make space for more fertile conversations

- Public health leaders adapted their language (e.g., replacing the word research with innovation)

...to avoid closing doors before people have absorbed what I have to say
-Public health leader

Translation work

- Demystifying application forms & processes to open up opportunities

Strategies could feel transgressive

You're feeling, am I allowed to do that? Am I not allowed to? You know, how far can I push? Do my colleagues around me understand what I'm doing?
-Collaborator

Early signs of changes in research activity

- Enhanced **profile of research**
 - evidenced through:
 - an increasing number of **research queries**,
 - **broader conversations** relating to research
- **Changes in *how* questions were being asked**
- Increased use of **theories of change & logic models**
- **Alignment** of research with **strategies/ corporate plans**

*That people are able to have a slightly wider conversation about, you know, not only 'How much does something cost and how many people are using it?' But 'are the right people using it?'.
-Public Health Leader*

*I don't walk on water.
My name's not Jesus!
-Embedded Researcher*

Changing a research culture is a **long-term** and **incremental** process
